L11 ANSWER 4 OF 5 PCTFULL COPYRIGHT 2006 Univentio on STN

DETD . . . as p53, could perhaps explain the
link to deletions of USPs in solid tumours. De-ubiquitination could play a
major role in the Mdm2 mediated control of p53 levels and its activation
mechanism, since the ubiquitin-mediated proteasome degradation of p53 is
an important effector arm of. . .

In recent years a number of other protein modifying polypeptide tags
have been identified. Many of these are related to ubiquitin and-have high
levels of identity and similarity (determined using the BLAST algorithm, for
instance) to ubiquitin itself. There is a recognised super family of such
proteins which. . .

. . .
human SUMO-1 (PIC1 1
Sentrin, hSmt3C), SUMO-2 (hSmt3A) and SUMO-3 (hSMT3B) belong to the
same family of UbL proteins with approximately 50% identity between
themselves, and some 15-30% identity and 40-60% similarity in amino acid
sequence to ubiquitin (Lapenta et al. 1997, Mannen et al. 1996, Kamitani et
al. 1998, Saitoh. . .

Several UbL hydrolase enzymes have been identified which convert
precursor UbL to active UbL. Some such enzymes interact with ubiquitin
itself as well as with other UbL's. Proteases involved in cleavage of
conjugates of UbL with target protein have been identified for instance
SENP1 and SUSP-1, which were recently cloned (Kim et al. 2000, Gong et
al. 2000a), and found to specifically cleave. . .

Valero, et al. (1 999) published after the first priority date of the
present application, have, in parallel identified this gene and pointed out the
gene product's sequence homologies to known USIP's in the conserred
peptide domains previously identified e.g. by d'Andrea et al (1 998). They
postulate a role in Alzheimer's disease. This protein has the HUGO
approved name USP25.

. . .
fusion protein of
the ubiquitin-like protein of interest and a detectable protein, and using the
usual separation and immune based or autoradiographic identification
techniques.

. . .
the specified domains,
some level of sequence homology with sequence ID 1 , for instance at least

20%, preferably at least 50%, identity with that sequence, and a level of
similarity of at least 50%, preferably at least 70% or more with that sequence
(in. . .
. . .
the corresponding mouse product, described in Valero, et al 1999 may be used or sequences which have the above levels of identity and
similarity with such a sequence.
. . .
outside the
specified domains, some level of sequence homology with sequence ID 1 for instance at least 20%, preferably at least 50%, identity with that
sequence, and a level of similarity of at least 50%, preferably at least 70% or
more with that sequence (in. . . as the corresponding mouse product, described in
Valero, et al 1999 may be used or sequences which have the above levels of
identity and similarity with such a sequence.

Experimental
We identify a portion of human chromosome 21 homozygously deleted in non-small cell non carcinoma (NSCLC) for further study. The region contained the DNA. . . et al. We found a shared region of overlap (SRO) for the hemizygous loss in other NSCLC. The current work is
to identify genes in the SRO which have a potential role in tumour
suppression.

The exposure was for 14 hr to Molecular Dynamics (Sunnyvale, CA) Phosphorimager screens. The I.M.A.G.E. Consortium (Lennon et al., 1996)
cDNA clone ID 82471 0 and the Unigene clone A0021343 have been used as labelled. . .

Identification and cloning of USP26
Twelve sequenced exon-trapped products, when analysed using BLAST-N against public sequence databases, revealed clusters of overlapping clDNA clones. Sequences. . .
. . .
with the binding of USP25 to its
natural ubiquitinated substrates, since this residue is conserved between all
UCH-s and USP-s so far identified.
. . .
of the sequences found to be interacting, from the GenBank database are given in the table,
Table 1. Summary of frequency and identities of specific interacting
proteins from human brain with USP25-C178A, detected using Yeast-Two-Hybrid technique
Summary of Results by Number of specific Accession number decreasing. . .
. . .
SUMO-
1 (PIC1 , Sentrin, hSmt3C), SUMO-2 (hSmt3A) and SUMO-3 (hSMT3B) belong to the same family of UbL proteins with approximately 50% identity
between themselves, and some 15-30% identity and 40-60% similarity in

amino acid sequence to ubiquitin (Lapenta et al. 1997, Mannen et al. 1996,
Kamitani et al. 1998, Saitoh. . .

Figure Legends

L17 ANSWER 1 OF 1 MEDLINE on STN
AB The p53 tumour suppressor is a short-lived protein that is maintained at low levels in normal cells by Mdm2-mediated ubiquitination and subsequent proteolysis. Stabilization of p53 is crucial for its tumour suppressor function. However, the precise mechanism by which ubiquitinated p53 levels are regulated in vivo is not completely understood. By mass spectrometry of affinity-purified p53-associated factors, we have identified herpesvirus-associated ubiquitin-specific protease (HAUSP) as a novel p53-interacting protein. HAUSP strongly stabilizes p53 even in the presence of excess Mdm2, and also induces p53-dependent cell growth repression and apoptosis. Significantly, HAUSP has an intrinsic enzymatic activity that specifically deubiquitinates p53 both in vitro and in vivo. In contrast, expression of a catalytically inactive point mutant of HAUSP in cells increases the levels of p53 ubiquitination and destabilizes p53. These findings reveal an important mechanism by which p53 can be stabilized by direct deubiquitination and also imply that HAUSP might function as a tumour suppressor in vivo through the stabilization of p53.

DETD . . . since in most of the cases an effective drug/treatment has to be found very rapidly, Furthermore, such developments currently involve very cost-intensive screening procedures until a particularly suited compound (often called Jead"-cornpound) is.found which could then serve as a chemical basis for an effective treatment.

. . . of course, alternative treatments for already known diseases. Furthermore, the need exists for a reliable, cost-effective, fast and autornateable method for screening such new effective compounds.

2. Screening for new biologically active compounds using ,combinatorial chemistry" The method of combinatorial chemistry is described as a profound change in the. . . AT, et al. ,Search and discovery strategies for biotechnology: the paradigm shift." Microbiol Mol Biol Rev 2000 Sep;64(3):573-606) In general, combinatorial chemistry involves screening of a specific (or a set of specific) compound with a vast number of otential biological candidate substances for example, pro-p teins) that might interact with the compound. Interacting partners are selected and used for further screening. Initially screened and isolated compounds can be used as Jead"-compounds for the development of biologically active compounds useful for treatment of dis-eases.

. . . potential utility for the treatment of conditions involving cerebral hypoxia." Life Sci 2000 Aug 1 1;67(12):1389-96) describe the use of HTS (high-throughput screening) libraries for reevaluation of the pharmacologic prop-erties of substances such as extract from the leaves of Ginkgo biloba Linne (form.. . .

Although the method of combinatorial chemistry exhibits several advantages in comparison to conventional methods for screening for biologically effective compounds which are useful for the development of new medicaments, there are still several drawbacks associated with this method.

The screening of a combinatorial chemistry library involves a

screening for a multitude of
different possible reactions and/or interactions of the comp6unds to be analysed with the in-
teracting partners. Therefore, the reaction conditions are assumed crucial for the result of the
screening. In particular, a compound which shows an
interaction with a target in such a corn-
binatorial assay in vitro might exhibit. . . prediction of an
effective compound very difficult and unreliable. As a result, an inter-
action in an in vitro combinatorial chemistry screening assay
can always only give a hint for a
potential biological function of the screened compound in
vivo.

As a result, combinatorial chemistry screening involves a
necessary second step; once a po-
tential target/lead compound has been identified/found, the
biological effect still has to be
confirmed/determined in an in vivo context. This makes compound identification using this
method unpredictable, slow and costly.

. . .
only individual regions
up to approximately 3000 base pairs in length have been examined, and an overall examina-
tion of cells to identify thousands of possible methylation
events is not- possible. However,
this method is not capable of reliably analyzing minute fragments from small. . .

. . .
Burkitt's lym-
phorna: molecular analysis of primary tumor tissue" Blood 1998 Feb 15;91(4):13 73-8 1)
- Wilms tumor (Kleymenova EV et al. "Identification of a
tumor-specific methylation site in
the Wilms tumor suppressor gene" Oncogene 1998 Feb 12;16(6):713-20)

.

The. present invention uses the modifications in the methylation pattern of the DNA for
screening of biologically effective substances. In general,
the invention uses the fact that the
biological effect of a potentially biologically effective drug,. . .

The invention has several advantages in comparison to other.
screening methods; in particular
combinatorial chemistry. First, the reaction conditions of the drug, chemical substance or
pharmaceutical composition with the biological test system. . .

Second, the analysis of the methylation pattern of the DNA allows screening of the in vivo
effect of the substance in a one-step procedure using one controllable reaction (namely, the
bisulfite treatment in order. . .

Thirdly, screening for potential lead-compounds becomes less
time consuming and less
costly, since the complete screening and analysis procedure
can be automated.

Fourth, the inventive method allows the inclusion of personal data into the selection/analysis

procedure which allows for a personalised screening of drugs, chemical substances or pharmaceutical compositions.

In a further preferred method according to the invention, the biological samples A and B are obtained from the identical individual, tissue, cell or other biological material.

. . .

or pharmaceutical composition. This allows the use of the inventive method to monitor and/or modify an already employed treatment regimen and to screen for unwanted side effects of the initially employed drugs, chemical substances or p harmaceutical compositions which leads to a strictly ,personalised" medicament. . .

. . .

cytosine methylation sites is analysed in parallel. The analysis of a multitude of sites in parallel allows for both an effective screening and a statistically highly relevant result of the method.

. . .

one to directly connect the tested drug, chemical substance or pharmaceutical composition with an effect on those genes and therefore allow the identification of possibly valuable new lead compounds as well as therapeutically important compounds.

In one embodiment, the method of the invention is characterised in that the identical biological sample, different biological samples or a combination thereof is used in steps a) and/or b).

Example 2

Screening of a peptide library

A peptide library was prepared in a 96-well culture plate which contained overlapping peptide fragments derived from the. . .

. . .

micro arrays representing 256 CpG and the inethylation statuses of the CpGs were analysed according to a method described in Example 3

Screening of a fractionated plant crude extract

In order to analyse the anti-metastatic effect of Celosia argentea seed extracts (CAE), which have traditionally. . .

(Uridine phosphorylase); UPK1B (Uroplakin 113); UROD (Uroporphyrinogen decarboxylase); UROS (Uroporphyrinogen III synthase (congenital erythropoietic porphyria)); USH2A (Usher syndrome 2A (autosornal recessive, mild)); USP7 (Ubiquitin specific protease 7 (herpes virus-associated)); VASP (Vasodilator-stimulated phosphoprotein); VCAM I (Vascular cell adhesion molecule 1); VDAC I (Voltage-dependent anion. . .

. . .

CD48 (CD48 antigen (B-cell membrane protein)); CD53 (CD53 antigen); CD58 (CD58 antigen, (lymphocyte function-associated antigen 3)); CD59 (CD59 antigen p18-20 (antigen identified by monoclonal antibodies 16.3A5, EJ16, EJ30, EL32 and G344)); CD63 (CD63 antigen (melanoma 1 antigen)); CD68 (CD68 antigen); CD7 (CD7 antigen. . . gene 3); LY64 (Lymphocyte antigen 64 (mouse) homolog, radioprotective, 105kD); LYZ (Lysozyme (renal amyloidosis)); MAPIB (Microtubule-associated protein 113); MDUI (Antigen identified by monoclonal antibodies 4172, TRALIO, TROP4, and T43); MIC2 (Antigen identified by monoclonal antibodies 12E7, F21 and 013); MICA (MHC class I polypeptide-related sequence A); MME (Membrane metalloendopeptidase (neutral endopeptidase, enkephalinase, CALLA,. . .

melanogaster muscleblind B protein); MDM2 (Mouse double minute 2, human homolog of, p53-binding protein); MHC2TA (MHC class 11 transactivator); MKI67 (Antigen identified by monoclonal antibody Ki-67); MNDA (Myeloid cell nuclear differentiation antigen); MSX1 (Msh (Drosophila) homeo box homolog 1 (formerly homeo box 7)); MTHFD. .

. . .

member 3)); LYN (V-yes-1 Yamaguchi sarcoma viral related oncogene homolog); MIS I (Membrane component, chromosome 1, surface marker I

(40kD glycopro-
tein, identified by monoclonal antibody GA733)); M4SI
(Membrane component, chromoso-
mal 4, surface marker (35kD glycoprotein)); MADH4 (MAD (mothers against
decapentaple-
gic, Drosophila) homolog. . . oncogene: family, protein
K); MASI (MASI oncogene); MAX (MAX protein); MCC (Mutated in colorectal
cancers);
MCF2 (MCF.2 cell line derived transforming sequence); MDM2
(Mouse double minute 2,
human homolog of-, p53-binding protein); MEL (Mel transforming oncogene
(derived from
cell line NK14)- RAB8 homolog); MELLI (Mel. . . mem-
ber 1)); LTB (Lymphotoxin beta (TNF superfamily, member 3)); MIS I
(Membrane compo-
nent, chromosome 1, surface marker I (40kD glycoprotein,
identified by monoclonal antibody
GA733)); M4SI (Membrane component, chromosomal 4, surface marker (35kD
glycopro-
tein)); MADH4. (MAD (mothers against decapentaplegic, Drosophila)
homolog 4);. . .

CLMEN. . . according to any of claims I to 4, characierised in that the
biological samples A
and B are obtained from the identical individual, tissue, cell
or other biological material.
. Method according claim 5, characterised in that the biological samples
A. and B. . .

28 Method according to any of claims I to 27, characterised in that the
identical biological
sample, different biological samples or a combination thereof is used in
steps a) and/or b).

AB The p53 tumor suppressor is a short-lived protein that is maintained at low levels in normal cells by Mdm-mediated ubiquitination and subsequent proteolysis. Stabilization of p53 is crucial for its tumor suppressor function. However, the precise mechanism by which ubiquitinated p53 levels are regulated in vivo is not completely understood. By mass spectrometry of affinity-purified p53-associated factors, the authors have identified herpesvirus-associated ubiquitin-specific protease (HAUSP) as a novel p53-interacting protein. HAUSP strongly stabilizes p53 even in the presence of excess Mdm2, and also induces p53-dependent cell growth repression and apoptosis. Significantly, HAUSP has an intrinsic enzymic activity that specifically

deubiquitinates p53 both in vitro and in vivo. In contrast, expression of a catalytically inactive point mutant of HAUSP in cells increases the levels of p53 ubiquitination and destabilizes p53. These findings reveal an important mechanism by which p53 can be stabilized by direct deubiquitination and also imply that HAUSP might function as a tumor suppressor in vivo through the stabilization of p53.
